

1. This week's Problem of the Week in Math is described as follows:

*There are thirty positive integers less than 100 that share a certain property. Your friend, Blake, wrote them down in the table to the left. But Blake made a mistake! One of the numbers listed is wrong and should be replaced with another. Which number is incorrect, what should it be replaced with, and why?*

The numbers are listed below.

6	10	14	15	21
22	26	33	34	35
38	39	46	51	55
57	58	62	65	69
75	77	82	85	86
87	91	93	94	95

Use the fact that the “certain” property is that these numbers are all supposed to be the product of *unique* prime numbers to find and fix the mistake that Blake made.

**Reminder:** Code your solution in an R script and copy it over to this `.Rnw` file.

**Hint:** You may find the `%in%` operator and the `setdiff()` function to be helpful.

**Solution:**

```
# Copy your solution code here.
```
